

Advances in the diagnosis of pancreatitis in dogs and cats (Online Webinar)

24/Feb/2025 (Mon) 8:00-9:20pm HK Time - 1 hour lecture + 20 mins Q&A

Fee: Free to attend

CPD Point: 1.25 (TBC)

.....

The diagnosis of pancreatitis remains challenging in dogs and cats. Traditionally, measurement of lipase activity has been used as a biomarker for pancreatitis, but all lipase activity assays available thus far measure a variety of different lipases and thus are neither specific nor sensitive. Measuring serum lipase immunoreactivity (PLI as measured by Spec cPL or Spec fPL), while sensitive and specific for pancreatitis, had an extended turn-around time.

In this webinar, Dr. Steiner will share the update of the new catalyst PL assay utilizes DGGR technology and is the first lipase activity assay that specifically measures pancreatic lipase. It can be measured in house and thus is ideal for patients that present with acute clinical signs. The assay has been standardized to provide equal numbers to the Spec PL assays and thus can be used interchangeably with those assays.
